**Build With Confidence**

## The Complete **Purlin** and **Girt System**

The Roofing & Profiles Products Zed and C sections are accurately roll-formed from high strength Zinc coated steel - G450 Z450 and combine to provide an efficient, lightweight, economical roofing and cladding support system for framed structures. The system, which includes a comprehensive range of accessories, is supplied ready for erection and, once erected, requires minimal maintenance throughout the life of the building.

ROOFING & PROFILES (FJU) LTD

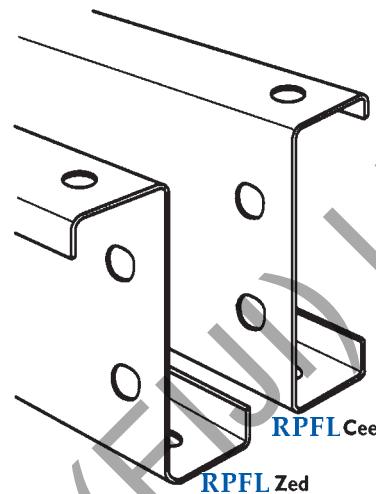

## General data for Zed & Cee Sections

**RPFL** Zed and Cee sections are accurately roll-formed from high-strength zinc-coated steel to provide an efficient, lightweight, economical roofing and cladding support system for framed structures.

### Applications

**RPFL** Zed sections may be used over single spans, unlapped continuous, and lapped continuous spans in multi-bay buildings. Lapped continuous spans result in a considerable capacity increase in the system.

**RPFL** Cee sections may be used in single spans and unlapped continuous spans in multi-bay buildings. Cee sections are ideal as eave purlins or where compact sections are required for detailing. Cee sections cannot be lapped.

### Range of products & services

Our wide range includes:

- A full range of **RPFL** Zeds and Cees;
- A full range of **RPFL** Zeds and Cees with downturned-lip;
- Section sizes from 100 mm to 250 mm;
- Technical information for cleatless connections (see Design notes for capacity tables);
- bridging systems;
- Bolting systems to suit project needs;
- Advice on improving the life expectancy of purlin systems in corrosive environments;

### Performance

In accordance with the provisions of AS/ANZ 4600:1996 *Cold-formed steel structures*, load capacities have been calculated for **RPFL** sections using approved **RPFL** bridging systems, bolting and other accessories. Sections chosen using the data provided in the tables will perform as specified when the design, fabrication and erection are carried out in accordance with **RPFL** recommendations and accepted building practice.

### Non-standard sections

We can supply a wide range of non-standard sizes (up to 250 mm) and shapes, including Cees and Zeds with downturned lip—the Zeds can also be made to lap.

### Corrosion protection & material compatibility

Some building materials and environmental conditions can be detrimental to coated steel products. These include contact with or exposure to runoff from:

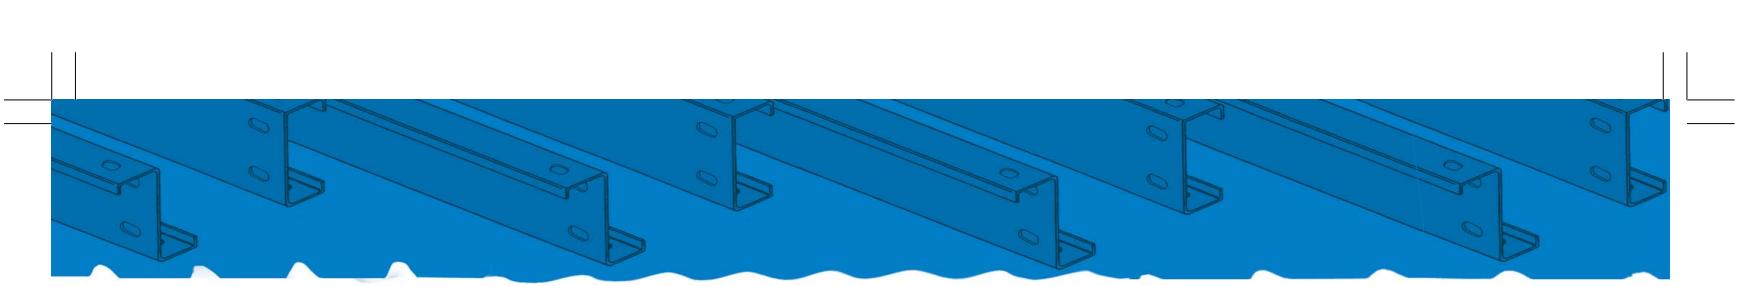

- industrial, agricultural, marine or other aggressive atmospheric conditions;
- incompatible metals, like lead or copper;
- building materials subject to cycles of dryness and wetness, or which have excessive moisture content such as improperly seasoned timber.
- materials which have been treated with preservatives, like CCA or tanalith-treated timber.

A zinc coating of G450 Z450 (450 g/m<sup>2</sup> minimum coating mass) is the standard coating class provided with **RPFL** Zed and Cee sections. This will provide a long and trouble-free life for enclosed buildings and open-sided rural buildings, in a non-aggressive environment.

### Standard range of **RPFL** Zeds and Cees

Nominal section size (mm)	BMT (mm)
100	1.9
150	1.5, 1.9, 2.4
200	1.5, 1.9, 2.4
250	1.9, 2.4

A non-aggressive environment is 1000 m from rough surf, 750 m from industrial emission and fossil fuel combustion, and 300 m from calm salt waters. Consideration must be given to the nature of activities performed within the building.

For severe corrosive environments Z450 (450 g/m<sup>2</sup> minimum coating mass) is required. This heavier coating mass is available.

All our Purlin raw materials are imported in Z450 coating.

Direct contact of incompatible materials with the coating must be avoided. In such applications, and in very corrosive environments, suitable paint systems can be obtained from paint manufacturers.

In applications where particular attention is required for corrosion, or the buildup of substances like dust or grain, then consideration should be given to the shape of the sections (either Zed, or Cee, or Zed with downturned lip); orientation of the sections; and coating class.

### Available lengths

**RPFL** purlins are available custom-cut in any transportable length, however there are some limitations.

Minimum length 1.2m and maximum length unlimited. (refer note below transportation)

For normal deliveries nominal lengths should not exceed **10.900 m**. Lengths greater than **10.900 m** require special transportation and on-site handling

Length tolerance for all sections is ±5 mm.

### Packing

**RPFL** Zed and Cee sections are delivered in strapped bundles. The actual quantity in each bundle will vary with section size, order and length.

### Storage on-site

If not required for immediate use, sections should be neatly stacked off the ground and on a slight slope so that water can drain away. Sections and accessories should not be left exposed in the open for extended periods.

### Material specifications

**RPFL** Zed and Cee sections are roll-formed from **GALVSTEEL** steel complying with AS1397—2001. In the grades shown, the number prefixed with G indicates minimum yield stress in MPa; and the number prefixed with Z indicates minimum coating mass in g/m<sup>2</sup>.

- 1.5, 1.9, and 2.4 mm BMT: G450, Z450

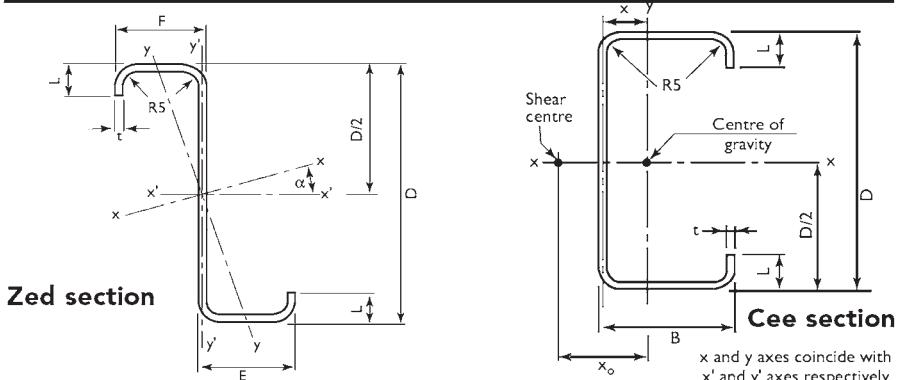

### Bolt specification

**RPFL** purlin bolts and nuts have integral washers.

Tighten all bolts to 55 Nm torque.

Nominal section size (mm)	Bolt specification
100, 150, 200, 250	M12 <b>RPFL</b> purlin bolt: standard (grade 4.6) or high strength (grade 8.8)

## Zed & Cee Sections Dimensions and properties

### RPFL Zed sections

**RPFL** Zed sections feature one broad and one narrow flange, sized so that two sections of the same size fit together snugly, making them suitable for lapping.

Continuous lengths of purlin result in better economy, but lapping provides two thicknesses of metal over interior supports. Lapping increases the strength of the sections where bending moments and shear are at a maximum, thus improving the load capacity and rigidity of the system.

**RPFL** Zed sections of the same depth and different thicknesses can be lapped in any combination.

**RPFL** Zed sections may also be used over simple spans. For shorter spans they may be used continuously over two or more spans without laps—thus producing reduced deflection compared with simple spans—but it does not give the strength of a fully lapped system.

**RPFL** Zed sections with one lip turned outward (called *downturned lip purlins*) may be used in simple or continuous spans with the ends butted.

Typical assemblies are shown later in this manual.

### RPFL Cee sections

**RPFL** Cee sections have equal flanges and are suitable for simply supported spans. For shorter spans they may be used continuously over two or more spans with the ends butted, thus producing reduced deflection compared with simple spans. They cannot be lapped.

Typical assemblies are shown later in this manual.

### Dimensions of Zeds & Cees

Catalogue number	t mm	D mm	Mass per unit length kg/m	Zeds			Cees

## Holes & Cleats

**RPFL** Zed and C sections are normally supplied with 18 x 22mm elongated holes punched to the Australian Institute of Steel Construction gauge lines. They are intended for use with standard M 12 purlin bolts as lapped Zed sections are not readily assembled on site with larger bolts. Where reactions are greater than the allowable load on two standard M 12 **RPFL** purlin bolts or greater strength bolts are desired. High strength M 12 purlin bolts are recommended. Sections are also available unpunched if required.

### Hole details & gauge lines - Zed & C sections

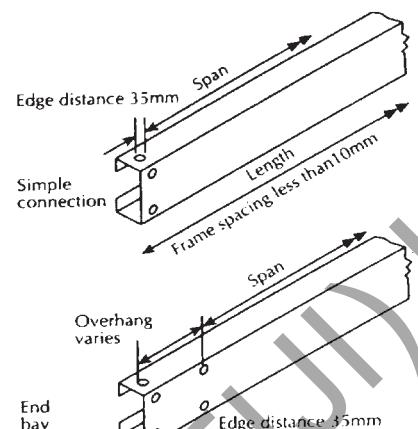

Nominal section size (mm)	Dimensions in mm	
	G (mm)	D <sub>H</sub>
100	40	18
150 - Other states	60	18
200	110	18
250	160	18

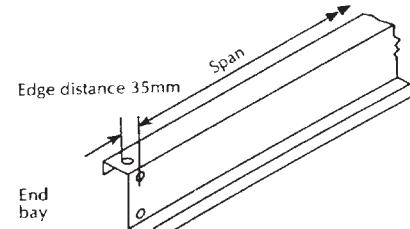

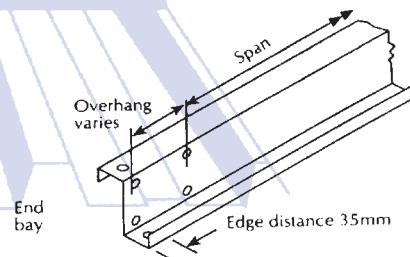

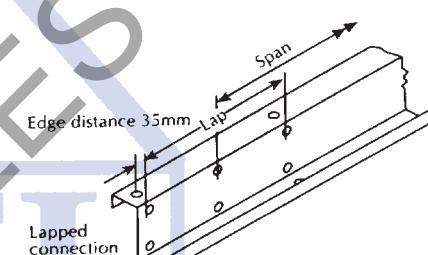

The holes are required at cleat supports at ends of laps and at bridging points.

For the webs of 100, 150, 200 and 250 deep sections the holes are elongated with dimensions of 18 mm x 22 mm suitable for M12 bolts.

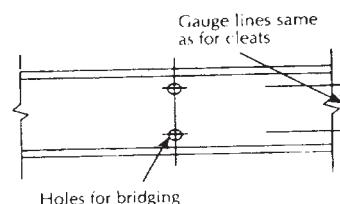

### Standard holing

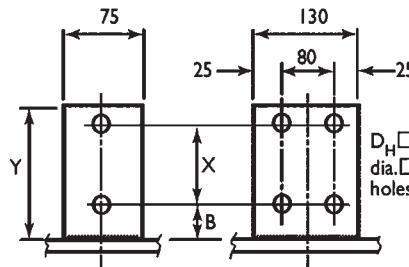

### End holes - Zed section

### Bridging holes Zed & C sections

## Hole details of cleats

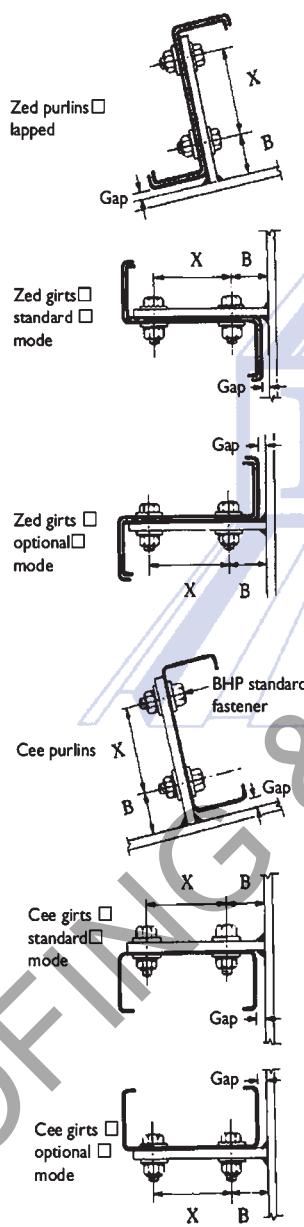

## Cleat nominal dimensions (mm)

Nom. section size (mm)	X	B	Y	t (thickness)	Gap	$D_H$
100	40	40	105	8	10	18
150	60	55	145	8	10	18
200	110	55	195	8	10	18
250	160	55	245	8	10	18

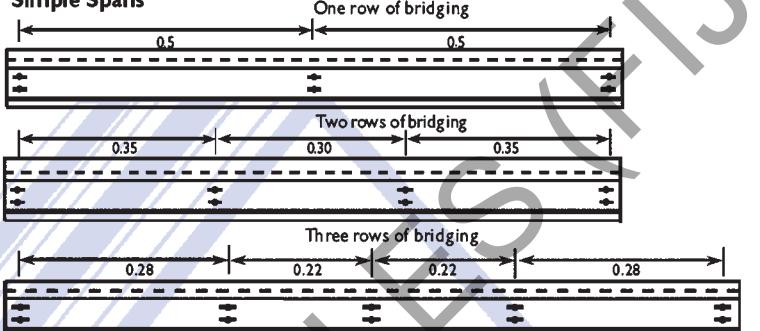

When using Zed sections with downturned lips, longer cleats are required to give clearance from the main supports.

## Fastening to cleats

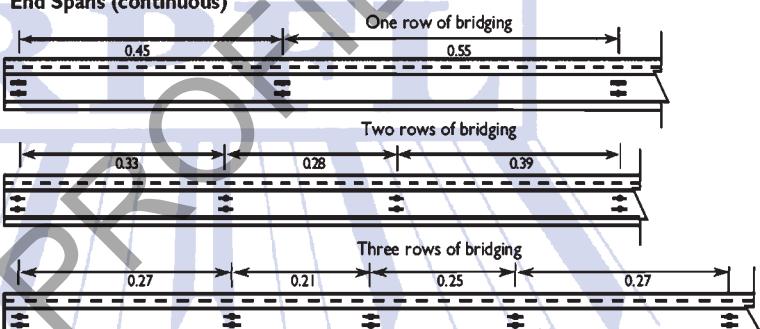

## Location of bridging holes

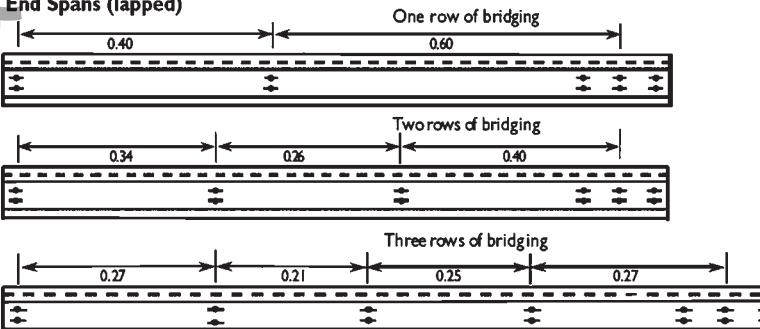

### Simple Spans

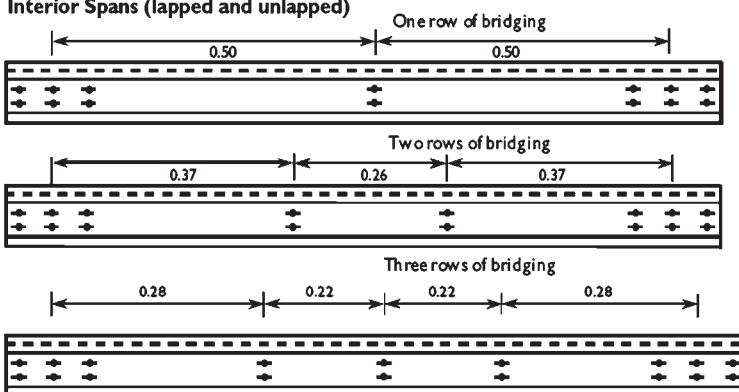

### End Spans (continuous)

### End Spans (lapped)

### Interior Spans (lapped and unlapped)

## NOTE

To minimise the tendency of Zeds and Cees to rotate when used as purlins, it is necessary to have the top flange pointing up the slope. Purlin orientation may be a consideration in certain projects.

## Design notes for capacity tables

When determining a design, consideration should be given to load combinations for both strength and for serviceability.

### Deflection

There are no specific rules governing acceptable deflections, though structural codes give guidance. You need to consider the specific requirements of any structure. It may be necessary to design for deflection under more than one load combination. See also *Assumptions used in tables*.

### Axial loads

Where a section is not loaded to its full capacity in bending, it has a reserve of strength to carry some axial load. This reserve in purlins and girts can be used to transmit forces due to wind loading on end walls, or to resist forces due to bracing of wall and roof structures.

Where required, the combined bending and axial load capacity should be calculated using AS/NZS 4600:1996 *Cold-formed steel structures*.

### Point loads

The values in this publication assume uniformly distributed loading. However, in many applications (like the mounting of services and maintenance equipment) the loads applied to a structure are point loads. Thus, to use these tables for point loadings, the loads must be converted to equivalent distributed loads.

The table on the following page gives conversion formulae for loads on simple spans and lapped spans. They have been derived from commonly published moment and shear data, and give conservative conversions.

For simple spans the formulae are straight forward. For non-continuous lapped spans the formulae depend on the number of spans, the position of the span and the lapping ratio; thus the worst-case configuration has been used, and the values may be safely used for end spans, interior spans and any lapping ratio greater than 10%.

Formulae for loads on continuous unlapped configurations, and for deflections in all configurations, are not given but may be derived similarly.

### Symbols used in table for conversion of point loads

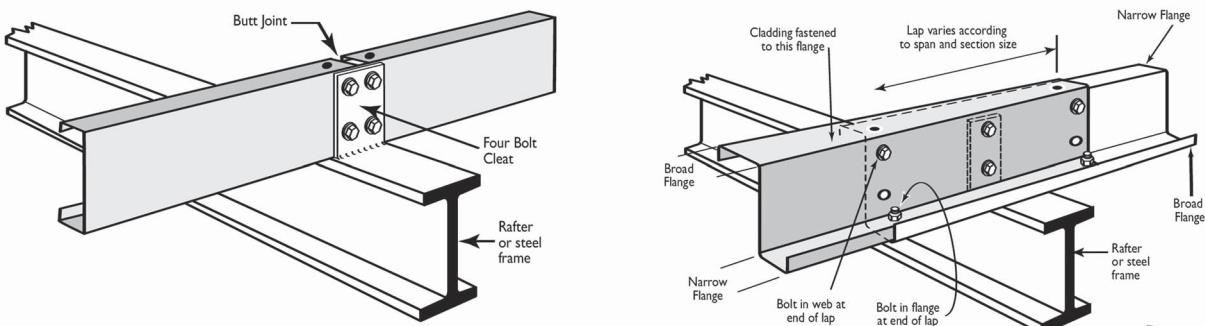

P = single point load (kN)

L = span (m)

a = larger distance from support (m)

b = smaller distance from support (m)

w = equivalent uniform load (kN/m)

### Design optimisation

- Cantilevers at one

### Design optimisation

The capacity tables provide economical design solutions for most projects. Designs can be optimised by varying:

- Material specifications
- Bolt specifications and number
- Non-standard purlin profile
- Reduced or enlarged end spans
- Span range

- Cantilevers at one or both ends

- Lap length
- Bridging quantity
- Load distribution

### Bridging

The capacity tables give solutions for an equal number of rows of bridging in each span. Provision is made for 0, 1, 2 or 3 rows of bridging.

In practice it may be necessary to use at least one row of bridging in each span. We suggest that unbridged lengths be limited to 20 times the section depth.

### Cleat connections

The capacity tables are based on the sections being fastened through the web to cleats (cleat connection) so that the load path is via the web of the sections.

The connections may be single section thickness such as in end connections, or the internal support connection of continuous configurations.

Connections with double section thickness occur at the internal support of lapped configurations.

Each connection uses two bolts.

### Cleatless connections

Fixing of purlins through the bottom flange of the purlin (cleatless connection) is used in some forms of construction. The purlin capacity tables should not be used for these types of connections. For these types of connections there are other design issues (both strength and serviceability) and construction issues that need to be considered.

The number of bolts used are halved compared with the number used in conventional cleated connections.

### Lapping

The structural lap at the interior supports of lapped configurations must be detailed to provide adequate structural continuity.

Each end of the lap must have one bolt through the flange furthest from the cladding, and one bolt through the webs near the flanges connected to the cladding.

The nominal lap length is the distance between the bolt centres at the end of the laps. Laps vary in length with both section size and span as shown in the table below. In no situation must the lap be less than 10% of the span. table below. In no situation must the lap be less than 10% of the span.

### Conversion of point loads into equivalent uniform loads

#### Symmetrical equidistant point loads

Loading condition		Conversion formula
SINGLE LOAD	Simple	 $w = 2P/L$
	Lapped	 $w = 2.22P/L$
2 LOADS	Simple	 $w = 2.67P/L$
	Lapped	 $w = 3.16P/L$
3 LOADS	Simple	 $w = 4P/L$
	Lapped	 $w = 3.78P/L$
4 LOADS	Simple	 $w = 4.80P/L$
	Lapped	 $w = 5.12P/L$
5 LOADS	Simple	 $w = 6P/L$
	Lapped	 $w = 6.65P/L$
6 OR MORE LOADS	Simple	 $w = 1.14NP/L$
	Lapped	 $w = 1.22NP/L$

#### Single eccentric and two symmetrical point loads

Loading condition		Conversion formula
SINGLE ECCENTRIC POINT LOAD	Simple	 $w = 8abP/L^3$
	Lapped	 $w = 17.76ab^2P/L^4$
2 SYMMETRICAL POINT LOADS	Simple	 $w = 8bP/L^2$
	Lapped	 $w = 9.45b(2L-3b)P/L^3$

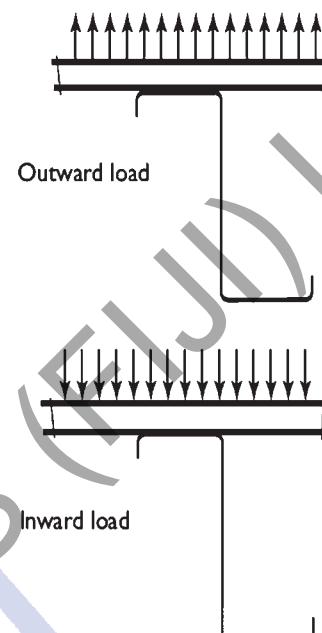

### Intermediate values

Within a given bridging configuration, capacities for intermediate spans may be interpolated linearly.

### Notes to capacity tables

1. Loads are assumed to be uniformly distributed (see also *Point loads*).
2. The capacities assume the use of approved **RPFL** sections, bridging system and bolts.
3. The column, Load for deflection span/150, is the load that will produce this deflection. It is not a design capacity.
4. All connections use **RPFL** purlin bolts grade 4.6, except for boldened capacities which require grade 8.8.
5. Forces acting to hold cladding against a structure are defined as *inward*. Forces acting to remove cladding from a structure are defined as *outward*.

### Loading conditions

### Lap lengths

Nominal section size (mm)	Span (mm)	Lap length (mm)
100	≤ 6000	600
	> 6000	900
150, 200, 250	≤ 9000	900
	> 9000 ≤ 12000	1200
	> 12000*	1800

\* Load capacities for these spans are beyond the scope of this publication

	7500	0.56	0.56				0.57

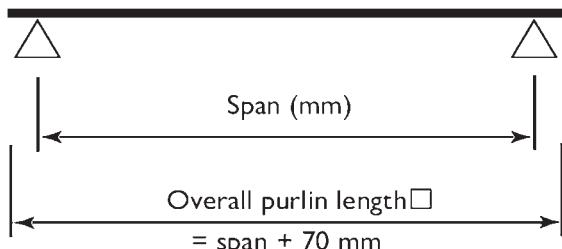

Bold capacities require grade 8.8 purlin bolts.

Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.  
IN = Inward load capacity. OUT = Outward load capacity. See also: Design notes for capacity tables.

Bold capacities require grade 8.8 purlin bolts. Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.

IN = Inward load capacity. OUT = Outward load capacity. See also: Design notes for capacity tables.

Bold capacities require grade 8.8 purlin bolts. Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.  
IN = Inward load capacity. OUT = Outward load capacity. See also: Design notes for capacity tables.

0.49	0.92	1.01		0.44	0.67	0.85	0.29	

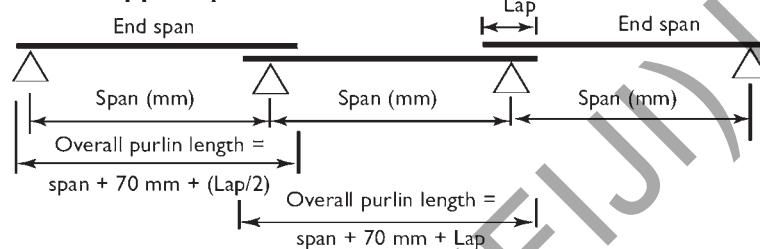

Bold capacities require grade 8.8 purlin bolts. Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.

IN = Inward load capacity. OUT = Outward load capacity. See also: Design notes for capacity tables. In mixed spans, the thicker section is used in the end spans.

Bold capacities require grade 8.8 purlin bolts. Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.  
IN = Inward load capacity. OUT = Outward load capacity. See also: Design notes for capacity tables.

## Limit state capacity tables

### Four lapped spans

**Four lapped spans**

The diagram illustrates a purlin system with four spans. Each span is labeled "Span (mm)". The total length of each span is indicated by arrows below the spans. The overall purlin length is calculated as "span + 70 mm + (Lap/2)" for each span.

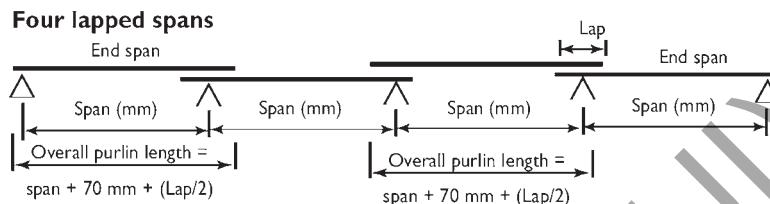

Bridging >	Span (mm)	IN			OUT			Load for defl'n span/150	
		0	I	2,3	0	I	2		
	3000	7.30	<b>9.68</b>	9.68	<b>9.68</b>	9.68	<b>9.68</b>	9.68	12.49

Bold capacities require grade 8.8 purlin bolts. Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.

IN = Inward load capacity. OUT = Outward load capacity. See also: Design notes for capacity tables. In mixed spans, the thicker section is used in the end spans.

## Limit state capacity tables

### Cantilever spans

1. The capacities are for cantilevers with single end span. The ends of the cantilevers are stabilised by fascias, bridging, barge boards, perimeter beams or similar structural members.
2. Bold capacities require grade 8.8 purlin bolts.
3. Bridging shown is for end spans only.
4. See also Design notes for capacity tables

### Bridging piece

Purlins are normally braced by alternating bridging members and tie rods. For flat roofs, up to 10° slope, alternate bridging without tie rods may be used.

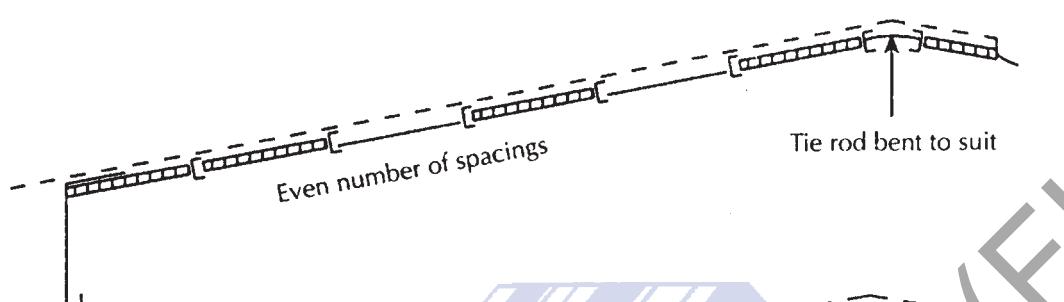

Purlin depth (mm)	A (mm)	B (mm)	C
102	65	40	Purlin spacing less 2mm
152	115	60	
203	160	110	
254	215	160	

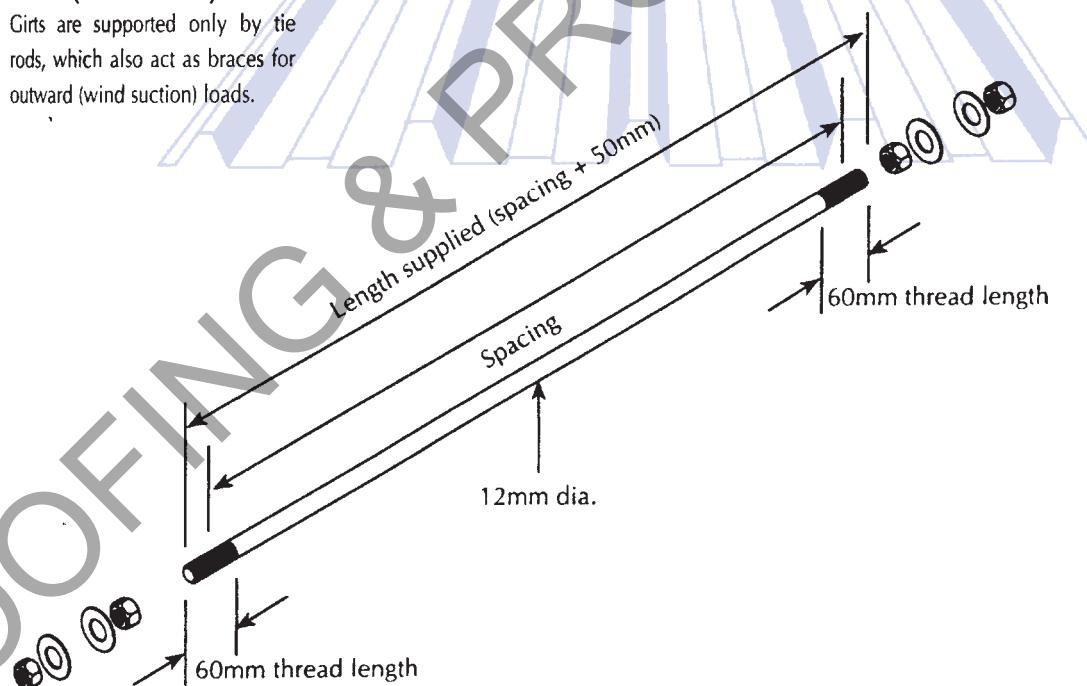

### Bridging and tie rod arrangements

For flat roofs, up to 10° slope, alternate bridgings without tie rods may be used. Tie rods are located in lower bridging holes

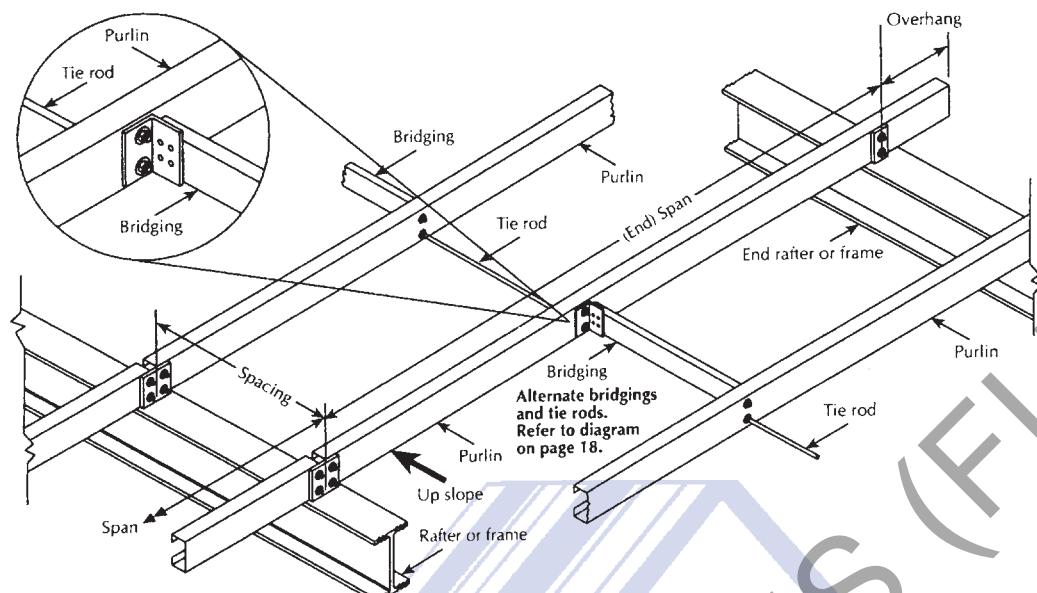

### Tie rod (GALVANISED)

Girts are supported only by tie rods, which also act as braces for outward (wind suction) loads.

## Purlin bridging system

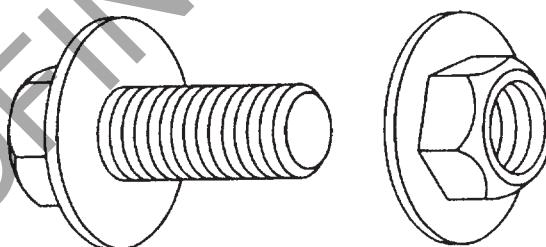

## Typical arrangement of in-line C Purlins

Upper lip of C purlins should face up the slope. Outside lip of girts should face upward.

**PB1230** Standard purlin bolt M12 x 30mm grade 4.6 with nut and washers HD Galvanised

**PB1230OHS** High Strength purlin bolt M12 x 30mm grade 8.8 with nut and washers.HD Galvanised

## Purlins bolts and nuts (flanged)

**PB1230** Standard **RPFL** purlin bolt

M12 x 30mm with nut

**PB1230OHS** High Strength **RPFL** purlin bolt

M12 x 30mm with nut Grade 8.8.
